B

Zoom Toggle Follows Selection
With the default Zoom Toggle setting, Live will zoom horizontally to fit the selection to the window, but keeps the vertical track height the same.
The default setting uses the last track height that was set

The benefit of using '*Fit To Window*' is that when user makes a selection across multiple tracks/ selects multiple Clips and then hits the 'Z' key, all the selected tracks will fit the screen.

Features

- If users work mainly with virtual and external *MIDI* instruments the users experience can be improved by adding an option to chase long notes when playing back from the middle it. If a user wants to create an evolving 2:00 min drone pad. Up until now the Edit Cursor has to start before the *MIDI* notes/events. Thanks to the new setting as soon as **Notes** is enabled under Editing Preferences and Edit Cursor is placed 1:00 min in, *MIDI* notes/*CC* will get chased as expected and play back correctly for the remaining time
